

PARKING STUDIES

Available, convenient parking is often a significant factor in local business patronage. It may even be the key element that enables the successful redevelopment of a community. Yet, issues associated with parking are not always clear without a full study that investigates parking availability and usage during different times of the day and week.

MCPC Services & Resources

The Montgomery County Planning Commission staff can analyze supply and demand, operational efficiency, traffic circulation, and parking access in any community. Using various geographic information system (GIS) tools, we can easily map parking availability and measure its convenience to local businesses. We can also analyze future development trends to better understand the impact on available parking. As part of the study, we can gauge public perception about parking and identify other issues related to parking in your community.

Where additional parking is not readily available, our planners can identify options to provide new parking opportunities. Our design planners can also perform conceptual layouts of existing and proposed parking facilities. Our staff can provide assistance when signage and marketing are all that is necessary to improve accessibility and usage of existing parking facilities.
